

South Dakota Radon Levels

Since the late 1980's, radon levels have been measured throughout the state of South Dakota. This data has been collected and compared to geological formations to yield the map shown below. The zone classifications are based upon being able to predict the likelihood of finding certain ranges of radon concentrations when conducting short-term radon measurements. The eastern portion of the state is Zone 1 with the balance being Zone 2. There are no Zone 3 areas in South Dakota.

These maps should not be used as a substitute for an actual radon test. The only way to determine radon concentrations in a building is to test.

Radon Potential by County

Proposed or Enacted Radon Legislation

No proposed or enacted radon legislation
